The present invention describes a short interfering nucleic acid (siNA) by RNA interference. Also described: (1) modulating expression of the SCD (stearoyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerctic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   double-stranded short interfering nucleic acid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a short interfering nucleic acid (siNh) that downregulates expression of the SCD (stearoyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNh; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antidiabetic, antidiabetic, antidiabetic, antidiabetic, antidiabetic, so modulate expression of SCD inhibiting virucide activities. The siNAs can be used to modulate expression of SCD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         short interfering nucleic acid; siNA; downregulation; inhibition; SCD; stearcyl-CoA desaturase; RNA interference; anorectic; antidiabetic; antiarteriosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

Human VEGFR1 short interfering nucleic acid (siNA) SEQ ID NO:585

(first entry)

12-FEB-2004

```
The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothalial growth factor receptor (VEGFF) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antiangiogenic, cytostatic, antidiabetic, nephrotropic and gynaecological, antiatritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating downregulating) the expression of VEGFF genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth
diabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma; polycystic kidney disease; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 19 BP; 8 A; 1 C; 7 G; 0 T; 3 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 3; SEQ ID NO 158; 207pp; English.

The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGER) gene. Also described: (1) a sinA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antiangiogenic, cytostatic, antidiabetic, ophthalmological, antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, diabetic retinopathy, macular degeneration, and polycystic kidney disease. The siNA may also be useful for diagnosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of engine-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 19 BP; 3 A; 7 C; 1 G; 0 T; 8 U; 0 Other;

                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a double-stranded short interfering nucleic acid (stNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA; with similar properties. The siNAs have antiangiogenic, cytostatic, antidiabetic, ophthalmological, antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating to (downregulating) a vide range of angiogenesis-associated conditions, useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, diabetic retinopathy, macular degeneration, and polycystic kidney disease. The siNA may also be useful for diagnosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, chung screening, target identification and validation, genetic
                                                                                                                                                                                                double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA; downregulation; short interfering nucleic acid; siNA; downregulation; cantidial growth factor receptor; VEGFR; antianglogenic; cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; alabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma; polycystic kidney disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                        Human VEGFR3 short interfering nucleic acid (siNA) SEQ ID NO:1650
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 3; SEQ ID NO 1650; 207pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                             (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, barticularly cancers, diabetic retinopathy, macular degeneration, neovascular y claubetic retinopathy, macular degeneration, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  short interfering nucleic acid; sing, downcaulation; vascular endothelial growth factor receptor, VBGPR, antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotroppic, gynaecological, angiogenesis-associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma;
  express siNA; and (5) single-stranded siNA with similar properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New double-stranded interfering nucleic acid, useful e.g. for treatment

The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGER) gene. Also described: (1) a siNA that downregulates the VEGF gene, (2) kits for in vitro or in vivo of siNA, (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidabetic, ophthalmological antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiotibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, angineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             short interfering nucleic acid; SiNA; downregulation; vascular endothelial growth factor receptor; VEGFR; antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma;

                                                                                                                                                                                                    The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular. Concleic acid (siNA) that downregulates expression of the vascular. Endochabilal growth factor receptor (VEGPR) gene. Also described: (1) a siNA that downregulates the VEGP gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, ortostatic, antidiabetic, ophthalmological, antiarthritic, antipsoriatic, nephrotropic and synascological activities. The siNA are useful for modulating (downregulating) the expression of VEGPR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, diabetic retinopathy, macular degeneration, and polycystic kidney disease. The siNA may also be useful for diagnosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA; downregulation; vascular endothelial growth factor receptor; VEGFR; antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma;

The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, ophthalmological, antiarthritic, antipsoriatic, nephrotropic and gynascological activities. The siNA are useful for andulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, barcularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA, downregulation; ascalar endothelial growth factor receptor; VEGFR; antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma;

The present invention describes a double-stranded short interfering nucleic acid (sinA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a sinA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of sinA; (3) conjugates and/or complexes of sinA; (4) vectors that express sinA, and (5) single-stranded sinA with similar properties. The sinAs have antialangiogenic, cytostatic, nephrotropic and gynaecological activities. The sinA are useful for modulating ophthalmological, antiatrhritic, antipsoriatic, nephrotropic and gynaecological activities. The sinA are useful for modulating consequiating the expression of VEGFR genes. The sinA are potentially particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, arbititis, psoriasis, endometriosis, angiofibroma, and plycystic kidney disease. The sinA may also be useful for diagnosis, dung screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-incledide polymorphisms). The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.4%; Score 15.8; DB 1; Length 19;

The invention relates to short interfering nucleic acids (siNA) which comparises to superassion of the human Myc or Myb genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense creations, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siNAs), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, candor complexes of siNA; and vectors that express siNA. The siNAs are andor complexes of siNA; and vectors that express siNA, in siNAs are capanisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be consed for treatment of a variety of conditions. They may be consed for treatment of a variety of conditions. They may be consed for treatment of a variety of conditions and so useful for treatment of a variety of conditions and so useful for drug screening, diagnosis, therapeutic target identification and the present sequence represents the upper strand of a human Myc-targeted double-stranded siNA, which is identical to the Myc transcript target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of Myc or Myb genes Example 7; Page 126; 161pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human Myc or Myb genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense cligonaclectide. The siNAs include short an antisense oligonaclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express sinAs are used to modulate expression of the Myc or Myb genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and creatment conflexed, diseases, such as restenosis and polycystic kidney disease. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene conflexed, services sinas and seconds of the Myc or Myb genes in cells (function, and gene mapping (e.g., of single nucleotide polymorphisms).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   single
                                                                                                                                                                                                                                                                                                        88; 8iNA; human; BCL2; short interfering nucleic acid; RNA interference; cytostatic; immunosuppressive; virucide; anti-HIV; cancer; autoimmune disease; viral infection; HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel short interfering nucleic acid (sink) that downregulates expression of the BCL2 gene by RNA interference. A sain of the invention has cytostatic, immunosuppressive, virucide, and anti-HIV activity. The sink are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. sink are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (e.g. of sing nucleotide polymorphisms). The sequences shown in ADF49273-ADF50143
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer or autoimmune disease, downregulates expression of the BCL2 gene.

```
The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of the BCL2 gene by RNA interference. A soll A of the invention has cytostetic, immunosuppressive, virucide, and anti-HIV activity. The siNA are useful for modulation (inhibition) of expression or activity of BCL2 by RNA interference. siNA are used to modulate expression of BCL2 genes, in cells, tissue explants or organisms, e.g. for treating cancer, autoimmune diseases and viral infections (including by HIV) but also for drug screening, diagnosis, target identification and validation, genetic engineering, phammacogenomics, studying gene function and gene mapping (e.g. of single nucleotide polymorphisms). The sequences shown in ADF49273-ADF50143

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1 creceptor (IGFT-IR) gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They comprise sense and may be double or single stranded. They further comprise sense and matisense regions, or alternatively are sesembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be chemically synthesised, expressed from a decoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits or sinA; and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms of sinA; and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms or treatment of a variety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restenosis and polycystic kidney diseases), inflammatory and/or allergic diseases, autoimmune diseases and transplant rejection. The siNAs are also useful for drug crecening, diagnosis, therapeutic target identification and validation, and gene companies, therapeutic target identification and validation, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence crepresents the upper strand of a human IGF-IR transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 3; SEQ ID NO 192; 147pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1 ceceptor (IGF-IR) gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include and an antisense oligonuclectide. Specifically, the siNAs include about interfering RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain decoyribonuclectides, and can be chemically synthesised, the invention also relates to kits ovector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA, and exectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the

treatment of a variety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restenosis and polycystic kidney disease), inflammatory and/or allergic diseases, autoimmune diseases and transplant rejection. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human IGF-IR-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-vabl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint

The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murtine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                     Gaps

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor receptor (EGFR) genes (including HER1, HER2 HER3 and HER4) by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain decoxyribonucleotides, and can be chemically synthesised, can contain decoxyribonucleotides, and can be chemically synthesised, can contain decoxyribonucleotides, and can be chemically synthesised, and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of EGFR genes in cells, tissue explants or organisms (eg., by ex vivo gene therappy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human HER2 (EGFR2) transcript target sequence/siNA upper strand, SEQ:158.
siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a HER2 (EGFR2)-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor receptor (EGFR) genes (including HBR1, HBR2 HBR3 and HBR4) by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New short interfering nucleic acid, useful e.g. for treatment and. diagnosis of cancer, downregulates expression of the epidermal growth factor receptor gene.

cc regions, or alternatively are assembled from a sense oligonucleotide and an antiense oligonucleotide. Specifically, the sinks include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also cand/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of EGFR genes in cells, tissue explants or corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants or creating a wide range of cancers such as breast and ovarian cancer. The citreating a wide range of cancers such as breast and ovarian cancer. The cathoristication and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide collable stranded siNA, which is identical to the upper strand of a characting a wide and double-stranded siNA, which is identical to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; agne function analysis; gene mapping; cancer; cytoetatic; human; oncogene; epidermal growth factor receptor; EGFR; HER2; EGFR2; neu; erbB2; c-erb-B-2; ss.

convergulate expression of one or more human epidermal growth factor receptor (EGFR) genes (including HER1, HER2 HER3 and HER4) by RNA receptor (EGFR) genes (including HER1, HER2 HER3 and HER4) by RNA increference. The siNAs may or may not comprise sense and antisense of double or single stranded. They further comprise sense and antisense of oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be enemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNAs are used to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or creating a wide range of cancers such as breast and ovarian cancer. The treatment of a variety of conditions. They may be used for treating a mide range of cancers such as breast and ovarian cancer. The creating are also useful for drug screening, diagnosis, therapeutic target complication, and gene mapping (e.g., of single nucleotide collymorphisms). The present sequence represents the upper strand of a content of the present sequence represents the upper strand of a content of the content of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to short interfering nucleic acids (siNA) which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human; T-cell associated disease; Vbeta; autoimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 15.8; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 1054
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADH70233,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ठ
                                                                                                                                                                                                                                                         The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor downregulate expression of one or more human epidermal growth factor receptors (including HER1, HER2 HER3 and HER3 by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (micRNA) and short can contain deoxyribonucleotides, and can be chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Can contain deoxyribonucleotides, and can be chemically synthesised. Can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of BGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or creating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target conduction, and gene mapping (e.g., of single nucleotide collaboration), genetic empires in the lower strand of a chemically such as breast and corporation of ethicity (e.g., of single nucleotide conducts). The present sequence represents the lower strand of a chemical such as breast such as breast and corporation of a stranded sinA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human HER2 (EGFR2) transcript target sequence/siNA upper strand, SEQ:154.

                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Wheta gene, WetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune disease, degenerative nervous system diseases, infectious diseases including autoimmune disease, whypersensitivity diseases, infectious diseases and neoplastic disease, Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple arrophic gastritis. Degenerative nervous system diseases include multiple arrophic gastritis as contact with allergens that lead to allergies. Type II hypersensitivities such as those present in callergies. Type II hypersensitivities such as those present in codpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HUY, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Wycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to human solid-cancer antigen peptides and encoding polynucleotides. The antigen peptides are selected from FIR, CENP-A, HOOK2, myomegalin, WRNI, KIAA1545, enigma, TROP2, mitosin, CU-EC-1. Cytostatic. The antigen peptides and their polynucleotides are applicable in early diagnosis and useful in treating solid cancer. With these 10 antigen peptides and their encoded polynucleotides, early diagnosis of solid cancer can be achieved accurately and quickly. The present sequence represents a RT-PCR primer for amplifying the DNA encoding a human solid-cancer antigen peptide FIR.
                                                                                                                                                                                                                                                                                                                                                                  Human solid cancer antigen peptides and polynucleotides useful in early

criteria. Also claimed are methods for gene-silencing, developing an sirah algorithm for selecting siRNA, selecting an siRNA with improved unctionality, selecting siRNA, selecting an siRNA with improved effective at silencing byperfunctional siRNA, an siRNA with improved siRNA. The siRNA molecule comprises a sequence substantially similar to a sequence consisting of GGGAGAUGAGGAGGA, GAAGUCAUCAUCAUGAGG, CAUGCGCCUCGGAGANA, AGAUGAGGAGGACAAU, GAAGUCACCCGAGAUA, AGAUGAGGAGGAGCAC, The siRNA molecule comprises a sense strand and an anti-sense strand. The siRNA molecule comprises a hairpin. The siRNA molecule comprises between 18 and 30 base pairs. The kit comprises at least two siRNA, comprising a first optimised siRNA for generating a gene silencing reagent. The present sequence is sired in the exemplification of the invention. The sequence is shown in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /*tag= a //note= at least one (and preferably all) of the backbone subunits are composed of N-acetyl N-(2-aminoethyl)glycine peptide residues, the nucleobase being attached covalently to the acetyl group and the peptide linkage being formed by condensation of the glycine carboxy group of one residue with the amino group of the 2-aminoethyl moiety in the next residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide nucleic acid oligomers specific for protein kinase C isozyme(s) - useful as anti:sense molecules for treating PKC mediated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel polynucleotides encoding all or part of cancer antigen peptide FIR (far-upstream binding protein interacting receptor) or peptides derived from it and polynucleotides encoding all or part of cancer antigen peptide CENP-A (centromere-specific protein A) or a peptide derived from it. The polynucleotides or primers, probes and substances containing them are use in a method for cancer diagnosis and especially diagnosis of colorectal cancer. The present sequence represents a PCR primer for amplifying the human FIR DNA.
                                                                                                                                                                           Cancer antigen polypeptides, nucleic acids encoding them and antibodies recognising them for specific and sensitive diagnosis of colon and rectal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of the nucleotide sequences that are complementary to a stretch of nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for selecting siRNA (short interfering RNA) comprising selecting an siRNA molecule of 19-25 nucleoside bases by selecting a target gene and measuring the functionality of sequences of 19-25 nucleotides in length that are substantially complementary to a stretch of nucleotides of the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gene silencing; Bcl-2; optimised; short interfering RNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                  ઠે
                                              New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation intiation AUG region, coding region, 5' untranslated region (5' UTR) or 3' untranslated region (3' UTR) of PKC-alpha or its isoforms. The PNAs can be used to target RNA and simple stranded DNA (sBNNA) to produce antisense-type gene regulation moieties. They inhibit expression of PKC-alpha and its isoforms (including beta, gamma, delta, epsilon, zeta and eta) and so are useful cor treating and diagnosing cell proliferation and differentiation processes such as neoplastic, hyperproliferation and differentiation or processes such as neoplastic, hyperproliferative and inflammatory diseases. PNA oligomers have high affinity for complementary single tranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or sBNNA and a second PNA strand binds with the resulting double helix or with the first PNA strand binds with the submitted of an an analysic of supplication charge and are water soluble, which facilitates cellular uptake. Further, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets the coding region of PKC-zeta. The sequences given in AAQ84244-51 are oligos which are antisense to the protein kinase C-zeta (PKC-zeta) cDNA. These antisense molecules may be used in modulating the expression of this particular isozyme of PKC. These oligomers have a *inhibition of PKC of <70%. The oligos of the invention preferably hybridise with the 5'- or 3'-untranslated regions of the invention preferably hybridise with the 5'- or 3'-untranslated regions of the invention preferably hybridise with the 6'- or 3'-untranslated regions of the invention preferably hybridise with the 6'- or 3'-untranslated regions of the end oligos may be used in the detection of the human PKC genes and for treatment of animals with conditions associated with PKC, esp.

These oligos may be used in the detection of the human PKC genes and for treatment of animals with conditions associated with PKC, esp.

Appropriate linkage and/or at least one of the nucleotides comprises a modification of the sugar, esp. a 2'- or methylor a modification of the sugar, esp. a 2'- or methylor a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the probes. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             obsition of the sugar, esp. a 2'- O-methyl or a (Updated on 25-MAR-2003 to correct PN field.)

AAV48564-708 represent antisense oligonucleotides directed against the jumb and jumb genes. Of these, only oligonucleotides AAV4855-614
resulted in effective downregulation of negative growth control by Jumb or Jumb, while AAV48615-708 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive rytosines; do not contain two sequences of three consecutive mucleotides able to form three H-bonds each to four consecutive cytosines; and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErbB-2, jumb, jumb, TGF-beta 1 or beta 2 to control consideration of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The consecution also be used to analyse function of proteins (by coligonucleotides can also be used to analyse function of proteins (by coligonucleotides can also be used to analyse function of proteins (by coligonucleotides can also be used to analyse function of proteins (by coligonucleotides can also be used to analyse function of proteins (by coligonucleotides can also be used to analyse function of proteins (by coligonucleotides can also be used to analyse function of proteins (coligonucleotides can also be used to analyse function of proteins (coligonucleotides can also be used to analyse function of proteins (coligonucleotides can also be used to analyse function of proteins (coligonucleotides can also be used to analyse function of proteins (coligonucleotides can also be used to analyse coligonucleotides can also be used to analyse coligonucleotides can also be asset to analyse coligonucleotides can also be asset coligonucleotices (coligonucleotides can also be asset coligonucleotides can are coligonucleotides can also be asset coligonucleotices of col
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in
junB; junD; antisense oligonucleotide; modulate; gene expression; ss.

necrosis factor alpha (TNP-alpha) 5'-flanking region. The present invention describes genetic variations involved in diseases associated with TNF-alpha which are screened for by detecting the presence or absence of one or more of the following mutations in the 5'-flanking region of the human TNF-alpha gene: (1) T in place of C at position -857; (2) A instead of C at -853; and (3) C instead of T at -1031 [positions 373; 367 and 199 respectively of the sequence given in AAX18575). The mutations increase TNF-alpha production in the cells involved. A suitable method for detection of these mutations is allele-specific oligonucleotide hybridisation (ASOH). TNF-alpha spentic variations associated with TNF alpha-implicated diseases such as juvenile rheumatoid arthritis, insulin-dependent diabetes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; tumour necrosis factor alpha; TNP-alpha; promoter; diagnosis; juvenile rheumatoid arthritis; chronic rheumatoid arthritis; insulin-dependent diabetes; insulin-independent diabetes; pCR primer; ss.
Diagnosis of genetic variation associated with diseases involving TNF alpha - such as rheumatoid arthritis or diabetes, by detecting mutation at positions 857, 863 or 1031 of the TNF alpha gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosis of genetic variation associated with diseases involving TNF alpha - such as juvenile rheumatoid arthritis, by detecting mutation at positions 857, 863 or 1031 of the TNF alpha gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                  AAV73026-V73071 are probes used to detect a single-base mutation in a human ras oncogene. These probes comprise 12-43 nucleotides of formula 5'-B-Q-D-3', Q=3 nucleotides complementary to the mutated codon, and B and D each = 0-20 nucleotides complementary to the ras sequences flanking the mutated codon. The probes are useful for detecting cancers associated with point mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; tumour necrosis factor alpha; TNP-alpha; promoter; diagnosis; juvenile rheumatoid arthritis; chronic rheumatoid arthritis; insulin-dependent diabetes; insulin-independent diabetes; ses

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is a primer for the human XLIS gene of the invention. The XLIS fragments may be used to detect abnormalities in the expression of the XLIS gene transcripts or to compare their sequence with that of the XLIS transcripts from patients for in vitro especially prenatal diagnosis of lisencephaly (LIS) (or agyria-pachygyria), subcortical laminar heterotopia (SCLH), cortical dysgenesis, cryptogenic epilepsies or neurodegenerative diseases such as Alzheimer's disease. These disorders mainly affect females as the XLIS gene is X-linked. The XLIS fragments may also be used to administer to patients to prevent or treat the above disorders and may be used as a tool in genetic counselling.
with TNF-alpha which are screened for by detecting the presence or absence of one or more of the following mutations in the 5'-flanking region of the human TNF-alpha gene: (1) T in place of C at position -857; (2) A instead of C at -863; and (3) C instead of T at -1031 (positions mutations in crease TNF-alpha production in the cells involved. A suitable mutations increase TNF-alpha production in the cells involved. A suitable method for detection of these mutations is allele-specific or oligonucleotide hybridisation (ASOM) TNF-alpha genetic variations associated with TNF alpha-implicated diseases such as juvenile rheumatoid arthritis, chronic rheumatoid arthritis, insulin-dependent diabetes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New gene and its gene product expressed in the brain, useful for diagnosing and treating disorders such as lissencephaly and subcortical

The invention relates to the isolation of a nucleic acid (AAA11284) coding for a transmembrane protein TRPC7 (AAY92944) which is expressed in brain and is homologous to transient receptor potential (TRP) protein. This suggests that the TRPC7 protein may have a calcium channel function. The genomic sequence has been shown to contain 31 introns. This sequence
                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids encoding transmembrane protein TRPC7 expressed in brain and homologous to transient receptor potential protein useful in the of treatment of associated diseases such as periodic psychosis.
ALIS gene from a sample for comparison to normal samples in the in vitro diagnosis regime. This may also be performed by amplifying XIIS CDNA from the mRNA in the sample. Antibodies to XIIS may be used to detect XIIS in a biological sample or can be administered to patients to prevent or treat the above disorders. They may also be used to patients to prevent or treat the above neurological sample. XIIS may also be used to purify XIIS from a biological sample. XIIS may also be administered to patients to prevent or treat the above neurological disorders. In addition XIIS may be used as a marker of neuronal cells at an early stage of development; its discovery increases understanding of both the neuronal movement which leads to development of the cortical region of the brain and of the

                                                                                                                                       ö
represents an exon/intron junction from the genomic TRPC7 sequence. The DNA and protein can be used in the diagnosis and treatment of disorders associated with TRPC7, especially the screening, monitoring and treatment (by gene therapy) of periodic psychosis, which appears to be associated with mutations in the TRPC7 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method which comprises making a high-density gene chip, specifically for making high-density micro-array of oligonucleotide probes. An oligonucleotide probe selecting process to seek preferentially length variable and coverage variable probes is provided to ensure identical cross melting temperature of probes to the maximum limit, and this can make the cross control of gene chip relatively simple and raise the relability of the gene chip results. The process proposes a specific probe selection method for and non-specific stres and a probe overall arrangement scheme. AAA79738 to AAA80201 represent oligonucleotide probe sequences which are used in

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZS9483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                             Novel antisense compound 8-30 nucleobases in length targeted to human fra -1 and which specifically hybridizes with and inhibits the expression of human fra-1, useful for modulating the expression of fra-1 in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense oligonucleotide; p38 mitogen activated protein kinase; MAPK; antirknematic; antiarthritic; immunosuppressive; cardiant; heart disease; antiinflammatory; autoimmune disease; rheumatoid arthritis; apoptosis; phosphorothioate; ss.
                                                                                                                                                                                                                                                The present sequence is one of a large number of antisense oligonucleotides which are targeted to nucleic acids encoding fra-1. The sequences may be oligodecoxyribonucleotides or chimeric oligonucleotides containing a central gap region consisting of ten 2'-decoxynucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-WDE) wings. The oligonucleotides have a phosphorothioate backbone and the cytidine residues in the 2'-MDE wings are 5-methylcytidines. The fra-1 antisense oligonucleotides are useful for inhibiting the expression of fra-1 in human cells or tissues. They can be used for diagnostics, therapeutics, prophylaxis and as research reagents and in kits. Use of the antisense compounds may also be useful prophylactically, e.g. to prevent or delay

translational translated region, translational start site, translational translational start site, translational termination region or 3'-untranslated region of a nucleic acid encoding a p38 mitogen activated protein kinase (MAPK), where the antisense oligonuclectides inhibit the expression of MAPK. Sequences AAC79501 represent human p38alpha MAPK and p38beta MAPK cDNA sequences. AAC79501 a AAC79500 and AAC79532 - AAC79570 represent human p38alpha antisense oligonuclectides, while AAC79502 - AAC79521 and AAC79571 - AAC79580 represent human p38alpha antisense oligonuclectides while AAC79536 solated from rat tissue. Murine p38beta MAPK CDNA is represented in AAC79533 and antisense oligonuclectides AAC79523 - AAC79536 isolated from rat tissue. Murine p38beta MAPK CDNA is represented in AAC79537 and antisense oligonuclectides have antifficumatic; antisting and inhibiting the expression of p38 MAPK in cligonuclectides are useful for inhibiting the expression of p38 MAPK in cells or tissues. The oligonuclectides are used for treating an animal with diseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthibities, or heart disease. The oligonuclectides are used for treating an animal with this titles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                     This invention relates to antisense compounds 8-30 nucleobases in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; mechanically sensitive potassium channel; riluzole; TWICK; polyunsaturated fatty acid; arachidonic acid; hTRAAK; chromosome 11q13; neuronal excitation; muscle excitation; cardiac rhythm; anoxia; hormone secretion; cardiac disease; vascular disease; ischemia; nervous system disorder; endocrinal disease; muscle disease; retinal disease; epilepsy; cardiac arrhythmia; neurodegeneration;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer for mechanically sensitive potassium channel gene fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
Antisense compound targeted to p38 mitogen activated protein kinase inhibits protein kinase and is useful for diagnosing and treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 15.8; DB 1; Length 20;

sequences, as well as antisense oligonucleotides capable of binding DNA. The antisense and antigene libraries are useful for preparing therapeutic agents for the treatment of genetic disease. The present DNA sequence is human C-Raf protein target DNA related to the invention. Note: The present sequence is shown as DNA in the specification; however, in vivo,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for selecting optimal subsequence antisense targets. The method involves preparing an antisense oligonucleotide capable of inhibiting mRNA expression of target mRNA sequences, as well as antisense oligonucleotides capable of binding DNA. The antisense and antisens libraries are useful for preparing therapeutic agents for the treatment of genetic disease. The present DNA sequence is phosphorothioate antisense oligonucleotide which is targetted to human C-

                                                                                                                                                                   PCR primers AAH78639-40 were used to amplify a gene fragment of the human mechanically sensitive potassium channel gene. The channel is activated by polyumsaturated fatty acids (particularly arachidonic acid (AA)) and by riluzole. The polypeptide is designated human TWICK-related AA-activated potassium channel (hTRAAK). The hTRAAK gene is located on chromosome 11q13. hTRAAK is involved in regulation of neuronal and muscle excitation, cardiac rhythm and secretion of hormones. Cells that express hTRAAK, designated to screen for modulators of hTRAAK activity. Such modulators are potentially useful for prevention or treatment, in humans and animals, of: cardiac and/or vascular disease; nervous system disocated with anomalous hormone secretion or muscle diseases associated with anomalous hormone secretion or muscle diseases and retinal diseases. Typical examples are epilepsy, cardiac arrhythmia and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for selecting optimal subsequence antisense targets. The method involves preparing an antisense oligonucleotide capable of inhibiting mRNA expression of target mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Selecting optimal subsequence antisense targets for inhibition of mexpression of target mRNA for the therapeutic treatment of genetic disease.
                                         New mechanically sensitive potassium channel, useful for treating cardiovascular diseases and in drug screening, is activated by polyunsaturated fatty acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 15.8; DB 1; Length 20;

The present invention describes a method for promoting the inhibition of the expression of a protein comprising employing a mammalian RNase H polypeptide so that cleavage of an RNA strand of an oligonucleotide-RNA complex duplex occurs. Also described is a compound 8 to 50 nucleobases in length targeted to the nucleic acid encoding the human RNase HII polypeptide, where the compound specifically hybridises with and inhibits the expression of a human RNase HII polypeptide. The compound, which is an antisense oligonucleotide, is useful for inhibiting the expression of a human RNase HII polypeptide in cells or tissues, as well as for a human RNase HII polypeptide in cells or tissues, as well as for treating an animal with a disease or condition associated with a human CR RNAse HII polypeptide. The method is useful for inhibiting the expression of a protein, particularly for reducing cellular RNA via antisense technology. The present sequence represents a human RNASE HII antisense coligonucleotide, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of a mammalian, particularly human, RNase H, for treating an animal with a disease or condition associated with a human RNase H, for inhibiting the expression of a protein, or for reducing cellular RNA via
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Unexplained recurrent pregnancy loss; immunologic reproductive failure; URPL; interleukin-loeta; IL-lbeta; human; tumour necrosis factor a; promoter; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an antisense compound 8 to 30 bases in length targeted to the 5' untranslated (UTR) region, the coding region or the 3' UTR region human Integrin-linked kinase (hIK). The antisense oligonuclectides are useful for inhibiting the expression of human hIK in human cells or tissues, in vitro. The oligonuclectides can be utilized for diagnostics, therapeutics for the treatment of diseases associated with the expression of hIK, prophylaxis e.g. to prevent or delay infection, inflammation or tumor formation and as research reagent
                                                                                                                                                                                                                                                                                                                                                                                   Antisense; integrin-linked kinase; hIK; infection; tumour; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense compounds capable of modulating expression of human Integrin-linked kinase, useful for diagnosis, prophylaxis and treatment of diseases, e.g. tumors, associated with expression of the kinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

therapy. The KTOMI nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOMI.

Compositions comprising the nucleic acids, proteins or antibodies may be used to treat subjects having defects in KTOMI which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, brain, heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta function. The sequence represents a PCR primer used in the invention to
                                                                                                                                                                                                                                                                                                                                                                                                New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic acids encoding the protein, useful for treating subjects having defects in KTOM1 which can manifest as cancer of the kidney, or as a disorder of e.g., liver or bone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel isolated nucleic acid encoding human KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse; antiinflammatory; gene therapy; ileitis; DST; ss; primer; real-time validation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Real-time validation forward primer for mouse clone IMX3_48.

                                                                                                                                                                                                                                                                                                                                                                                                  Evaluating risk of unexplained recurrent pregnancy loss in a subject, by testing presence of a variant in interleukin-1 beta promoter region and/or in CD46 gene intron 1 region in a sample obtained from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for evaluating and treating risk of unexplained recurrent pregnancy loss (URPL) in a subject suspected of having immunologic reproductive failure. The method involves testing a sample obtained from the subject for the presence of a variant in the human interleukin-lbeta (IL-lbeta) promoter region, and/or a variant in the CD46 gene intron 1 region, where the presence of the variant, indicates an elevated risk of developing recurrent pregnancy loss. The present sequence is human tumour necrosis factor a (TNFA) promoter amplifying PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; KTOM1a; KIOM1; kidney tumour overexpressed membrane; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                           The invention relates to a novel isolated nucleic acid molecule comprising a polynucleotide having one of 90 polynucleotide sequences, given in the specification. The polynucleotides of the invention have antiinflammatory activity, and may have a use in gene therapy. The polynucleotide or a polypeptide encoded by it is used for preventing, treating, modulating or ameliorating a medical condition such as ileits. The polypeptide or polynucleotide is also useful for manufacturing a medicament for treating ileitis. The sequence represents a real-time validation primer for the DNA sequence obtained from one of the mouse
                                                                    New isolated nucleic acid molecules that are associated with ileitis, for preventing, treating, modulating and diagnosing ileitis in a mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neuroprotective; cerebroprotective; nootropic; cytostatic; cardiant; nephrotropic; osteopathic; antiallergic; antiarteriosclerotic; anti-microbial; diabetes; infection; dementia; cytochrome P; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transgenic animals having drug metabolism enzyme genes, useful in testing fetotoxicity and/or teratogenicity and applicable to drug development for diseases including diabetes, infections and dementia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a recombinant gene that comprises, a gene encoding human P450 or its variant, the human EFlalpha promoter, chick beta globin insulator sequence or a part of it, and the SV40 polyA-
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

attached signal. The activity of the gene of the invention may be described as, antidiabetic, neuroprotective, cerebroprotective, nootropic, osteogethic, artialergic, nootropic, categorathic, antiallergic, antiarteriosclerctic and anti-microbial. The intention of this invention is to provide a transgenic animal. The animal is useful in testing fectoxicity and/or teratogenicity, and is applicable to drug development for diseases including diabetes, infections and dementia. The current sequence represents a primer designated OYP2E1 sense primer, which is used in an example from the invention in the amplification of cytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to the isolation of novel human proteins (designated PP491, PP5644, PP6668, PP6361, PP6485, PP6489, PP6614, PP66181, PP6632 and PP6931) with cancer cell growth suppressing function, and the polynucleotide sequences encoding them. Also described is the process for preparing the proteins by DNA recombination and the supplication of the polypeptides and polynucleotides in treating diseases such as cancer. ABS5/355-ABS5/374 represent PCR primers used in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human cancer cell growth suppressing protein PP6781 cDNA, PCR primer #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleobases in length targeted to a nucleic acid molecule encoding p38 micogan-activated protein kinase (MAPK). The products of the invention have antiarthritic and antiinflammatory activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "nucleotides 1-5 & 16-20 are 2'-methoxyethoxy (MOE) nucleotides, nucleotides 1-4 & 16-19 are linked via phosphodiester linkages, nucleotides 6-15 are 2'-deoxy- nucleotides, nucleotides 5-16 are linked via phosphorothicate linkages, all C nucleotides are 5-methyl cytosines"
                                                                                                                                                                                                                                                                                                                                                               p38 mitogen-activated protein kinase; p38 MAPK; phosphorothioate; antisense; antiarthritic; antiinflammatory; kinase inhibitor; mouse; inflammatory disease; rheumatoid arthritis; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel antisense compound, which is 8-30
                                                                                                                                                                                                                                                                                                Murine p38-alpha MAPK antisense oligonucleotide ISIS NO 100802
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 15.8; DB 1; Length 20; Pred. Sequences ABZ74952-ABZ74991 represent antisense oligonucleotides targeted to the human p70 S6 kinase gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human p70 S6 kinase RNA, and were analysed for their effect on mRNA levels by quantitative real-time PCR. p70 S6 kinase (also known as SK6, p70/p85 s6 kinase, p70/p85 ribosomal S6 kinase and pp70s6k) is a serine-threonine kinase responsible for the phosphorylation of the ribosomal S6 protein, which in turn stimulates protein synthesis. p70 S6 kinase function is essential for cell cycle progression, and has also been implicated in the regulation of the immune response. p70 S6 kinase is itself activated via phosphorylation, a process influenced by upstream signalling cascades and by hyperinsulinaemia, and may play a role in the progression of colon cancer and in the development of lipotoxic of the progression of disorders
                                                                                                                                                                                                                                                                                                                                                                                                     /note= "Phosphorothioate linkages. When bases 1-5 and 16-20 are not 2'-methoxyethyl (2'-MOE) nucleotides, all cytosines in the oligonucleotide are 5-methylcytosine"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compound which is targeted to nucleic acid encoding p70 S6 kinase, and inhibits expression of p70 S6 kinase, useful for treating a condition associated with p70 S6 kinase, e.g. cancer.
                                                                                                                              Human; p70 S6 kinase; SK6; p70/p85 s6 kinase; pp70s6k; pp70/p85 ribosomal S6 kinase; serine-threonine kinase; ribosomal S6 kinase; serine-threonine kinase; ribosomal S6 protein phosphorylation; protein synthesis; cell cycle progression; immune response; signalling cascade; cancer progression; liptocxic disorder; obsativ; metabolic disorder; hyperproliferative disorder; cancer; cytostatic; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and obesity. The oligonucleotides of the invention are useful for the prevention and treatment of conditions associated with p70 S6 kinase, such as hyperproliferative disorders such as cancer, and metabolic disorders. They are also useful in research and diagnostics for modulating the expression of p70 S6 kinase
                                                                                            Human p70 S6 kinase phosphorothioate antisense oligo, SEQ ID NO:24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2'-methoxyethyl (2'-MOE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "Optionally 2'-methoxyethyl (2'-MOE;
All 2' MOE cytosines are 5-methylcytosine"

```
The invention relates to the isolated polynucleotides of a repeated tract within intron 1 of the zinc finger protein 9. The isolated polynucleotides comprise nucleotides 1-14468, 14444-22400, 17501-17701 and optionally a repeat tract, 17858-18062 and optionally a repeat tract, of a 22400 base pair sequence given in the specification, or its complements, or at least about 15 consecutive nucleotides from 16701-17701 or 17858-18862 of the 22400 by sequence. The polynucleotides of the invention are useful in identifying individuals at risk for developing myotonic dystrophy type 2 (DM2). This polynucleotide sequence represents a PCR primer of the human zinc finger protein 9 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide for determining whether an individual has, is at risk, or is not at risk for developing myotonic dystrophy type 2, comprises a repeat tract within intron 1 of the zinc finger protein 9
                                                                                                                                                                                                                                                                                                                                       tract; intron 1; zinc finger protein 9; myotonic dystrophy type 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to detecting and differentiating porcine circovirus (PCV) infections, comprises extracting nucleic acid from a biological asmaple taken from a pig, amplifying a fragment from the extracted nucleic acid, digesting the amplified fragment with a restriction earyme, forming a restriction fragment length polymorphism (RFLP) pattern from an undigested or digested fragment, and detecting the presence or absence of a PCV isolate. Also included are an oligonuclecide primer for differentiating PCV infections, comprising a fully defined MCV1 or MCV2 mucleotide sequences (ADA09085 and ADA09086) and an assay kit for detecting and differentiating PCV infections, comprising the oligonucleotide primers and a restriction enzyme. The methods and compositions of the present invention are useful for diagnosing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treating porcine circovirus infection (especially postweaning multisystemic wasting syndrome, PMWS, in pigs). The method of the present invention, as compared to prior art, is more rapid, sensitive, easy to perform and specific for the porcine circovirus and its associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a PCR/sequencing primer for performing

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6423.1, and is also known as ctgrofact, fibroblast inducible secreted protein. 2, 1618p-12, 100V2, insulin-like growth factor binding protein related protein. 2, 1GFBP-12, IGFBP-18, Hcs24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in accute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This oligonucleotide sequence is a chimeric phosphorothioate antisense oligo with 2' MOE wings and a deoxy gap, which is used to inhibit expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 3; Page 89; 139pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2003-559091/52.
This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 623:1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, IGFBP-8, Hose24 and ecogenin. It is known to stimulate DNA synthesis and IGFBP-8, Hose24 and ecogenin. It is known to stimulate DNA synthesis and coute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonuclectides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), cub, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       22-FEB-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-JUN-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rheumatoid arthritis). The present DNA sequence represents a 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to mouse TGF-beta receptor II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compound having a sequence targeted to a nucleic acid encoding
Transforming growth factor beta-receptor II, useful for preparing a
composition for treating hyperproliferative disorder e.g., lung, liver,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and andocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to a primer used to amplify and isolate the coding sequence for one of the polypeptides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compounds that hybridizes with nucleic acid molecules encoding farnesyl transferase beta subunit and inhibits the expression of farnesyl transferase beta subunit, useful for treating e.g. cancer or inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense oligonucleotide; phosphorothioate linkage,

```
in cells or tissues and a method of treating an animal having a disease or condition associated with the FT-beta subunit. The compound is an antisense oligonuclectide, preferably a chimeric oligonuclectide, which comprises at least one modified internucleoside linkage which is a phosphorothioate linkage, at least one modified sugar moiety which is a 2'-O-methoxyethyl sugar moiety or at least one modified nucleobase which a 5-methylcytosine. The compound is useful in inhibiting the expression of the FT-beta subunit in cells or tissues. It can also be used for treating cells or conditions associated with the FT-beta subunit, such as typerprofilerative disorders, including cancer (such as ovarian carcinoma, adenocarcinoma, colorectal cancer, pancreatic cancer or prostate cancer) and inflammatory conditions. The antisense compounds can also be used as research agents, in diagnostics or for preventing or delaying infection, inflammation or tumour formation. This sequence represents a human farnesyl transferase beta subunit phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

ò

The invention relates to a compound targeted to a nucleic acid molecule encoding the human farnesyl transferase beta (FT-beta) subunit and inhibits the expression of the (FT-beta) subunit, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding the FT-beta subunit. The invention also relates to a method of inhibiting the expression of the FT-beta subunit

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or Disclosure; SEQ ID NO 6974; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or deptenting levels of or entiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition.

Und inflammation, lung allergies, or a respiratory disease or condition. Specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 20 BP; 11 A; 0 C; 1 G; 8 T; 0 U; 0 Other;

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 6972; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a composition are spiratory, lung or malignant crespiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or enclainflammatory steroid in a subject, for reducing levels of adenosine creeptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 13862; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an nasal airway dysfunction and a second active agent comprising an has antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is sufful for treating or preventing a respiratory, lung or maligiant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, the printed lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a method of selecting a single chain antibody (scFV) against a peptide target in a yeast by expressing a library of scFV tusion proteins in yeast cells, expressing a target fusion protein in the yeast cells expressing the scFV fusion proteins having either the DNA binding domain or the activation domain of the transcription activator which is not comprised in the scFV fusion proteins, and a target peptide, and selecting those yeast cells in which a reporter gene is expressed. Each scFV fusion protein comprises either an activation domain or a DNA binding domain of a transcription activator and a scFV having a heavy chain of a variable region (WH) of antibody whose sequence variable region (WH) of antibody whose sequence varies within the library independently of the VH antibody whose sequence varies within the library independently of the creporter gene is activated by a reconstituted transcriptional activator formed by binding of the scFV fusion protein to the target fusion are useful for protein. The methods and compositions of the present invention are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Selecting an scFv against a peptide target by expressing a target fusion protein having a DNA binding domain or activation domain of a transcription activator, useful for diagnosing, preventing and/or treating HIV infection and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for preventing and/or treating HIV infection and cancer. This sequence corresponds to tan oligonuclectide used to generate the scFv antibody of

```
The invention describes a multimeric molecular complex comprising at least 2 compounds, each of which has at least one targeting element directed to a ligand that confers transcytotic or paracellular transporting properties to a molecular complex specifically bound to the ligand. Also described are: a compound comprising at least 2 targeting elements directed to the ligand; a protein compusion at least 2 targeting to composition composition to the ligand; a plant and an element directed to the ligand; a pharmaceutical composition comprising the compound; delivering a biologically active agent to an animal; transporting a biologically active agent to an animal; transporting a biologically active agent to an animal; treating a disease in an animal; or disease in an animal. The complex is useful for preparing a composition for diagnosing or treating diseases, e.g., osteoporosis, renal failure, colitis, gastroenteritis, inflammatory bowel disease, psoriasis, Alzheimer's disease, optic neuropathy or ophthalmoplegia. This sequence represents a linker associated with the isolation of heavy chain regions from the single chain antibody spv5AP polypeptide, that targets the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention relates to an antisense oligonucleotide 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding a p38 mitogen activated protein kinase (MAPK), where the antisense compound inhibits the expression of the p38 MAPK. The antisense oligonucleotide is useful for inhibiting the expression of p38 MAPK in cells or tissues. It is also useful for treating an animal having a disease or condition associated with p38 MAPK, e.g. an inflammatory or an autolimnuc disease (e.g. rheumatoid arthritis) or a heart disease. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a p38 MAPK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides for modulating p38 mitogen activated protein kinase (MAPK) expression, useful for diagnosing, preventing or treating diseases associated with p38 MAPK, e.g. inflammation or heart

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating or target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to

to Pharmaceutical composition for treating asthma, has antisense objigonucleotide containing less percentage of adenosine, targeted tuncleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 6971; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The

```
Composition of atarget polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The instruction or cancer and can be anti-sense to the corresponding mRNA. The instruction also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) adelivery of instructions for adding a carrier and for use of the kit. The composition of invention has antialergic, antialfammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to confine an antial and or availability, and/or bronchoconsfriction and/or lung confine and or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, charactery pain, cystic fibrosis, allergies thinitis, pulmonary contension, emphysema, chronic obstructive pulmonary disease, pulmonary content of the anti-sense olgose corresponding to thymidines present in the target RNA serves to prevent the breakdown of the unity beaution and the present in the target RNA serves to prevent the breakdown of the plant of the anti-sense of the plant of the partice manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          e.g., lung, brain, heart, kidney, etc, prevent any unwanted effects due to it

```
This invention describes a novel composition (a) a first active agent, comprising oligomucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and control depletion or hyposecretion, when administered to a mammal. The oligomucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or reduce the amount of target polypeptide present in the lungs. The culticammation, allergies and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary viseconstriction, cinflammation, allergies and/or bronchoconstriction, respiratory disease, pulmonary compagnate, pain, cystic fibrosis, allergic rhinitis, pulmonary content of the anti-sense oligos corresponding to the hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary cransplantation rejection, pulmonary infections, branchines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenomine into the system e-g., lung, brain, heart, kidney, etc, tissue environment and thereby, to the prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                    invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to a new compound comprising 8-50 nucleobases in
length targeted to a nucleic acid molecule encoding protein phosphatase 3
CPPPRIX, the regulatory subunit of calcineurin), where the compound
specifically hybridises with the nucleic acid and inhibits the expression
of PPPRIX, i.e. is an antisense oligonucleotide (AO). Also included are a
compound 8-50 nucleobases in length which specifically hybridises with at
least an 8-nucleobase portion of an active site on a nucleic acid
molecule encoding PPPRIX, a method of inhibiting the expression of PPPRIX
in cells or tissues (comprising contacting the cells or tissues with AO
contacting a disease or condition associated with PPPRIX (comprising
administering AO to the animal so that expression of PPPRIX is inhibited)
and a method of screening for an antisense compound (comprising
contacting a preferred target region of a nucleic acid molecule encoding
PPPRIX with one or more candidate antisense compounds which
an enclobase portion which is complementary to the preferred target
region, and selecting for one or more candidate antisense compounds which
inhibit the expression of a nucleic acid encoding PPPRIX is inhibited
and compositions of the present invention are useful for the diagnosis,
pervention and or activity of BPPRIX is not anti-
pervention and anticinal and antiched antisense diagnosis,
and selecting a preferred pervention are useful for the diagnosis,
and composition or activity of BPPRIX is not anti-
pervention and anticinal antiched antisense diagnosis,
and an active and a preferred and encoding and antiched antiched antiched and antiched and antiched and antiched and antiched antiched and antiched and antiched antiched and antiched and antiched and antiched and antiched antiched and antiched and antiched and antiched and antiched antiched and anticked with an antiched antiched and antiched and antiched and anticked and antiched and antiched and anticked and an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonuclectide compounds, useful for diagnosing, preventing and/or treating conditions with aberrant activity of PPPJRI, such as autoimmune disorders, aberrant calcium signaling and Alzheimer's
                                                                                                                                                                                              /mod_base= OTHER

The invention relates to a new compound comprising 8-50 nucleobases in length targeted to a nucleic acid molecule encoding protein phosphatase 3 (PPPSRI, the regulatory subunit of calcineurin), where the compound specifically hybridises with the nucleic acid and inhibits the expression of PPPSRI, i.e. is an antisense oligonucleotide (AO). Also included are a compound 8-50 nucleobases in length which specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding PPPSRI, a method of inhibiting the expression of PPPSRI is inhibiting the expression of PPPSRI is inhibitied) and an inhal having a disease or condition associated with PPPSRI (comprising administering AO to the animal so that expression of PPPSRI is inhibited) and method of screening for an antisense compound (comprising contacting a preferred target region of a nucleic acid molecule encoding PPPSRI with one or more candidate antisense compounds thaving at least an 8-nucleobase portion which is complementary to the preferred target

The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(les), asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome
region, and selecting for one or more candidate antisense compounds which inhibit the expression of a nucleic acid encoding ppp3R1). The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of ppp3R1, such as autoimmune disorders, conditions having aberrant calcium signaling and neurological diseases like Alzheimer's disease. The present sequence is an anti-ppp3R1 antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel single or multiple target oligonuclectide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to meuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy; or ataxia. The sequence represents a chimeric phosphorothioate oligonucleotide with 2.7ME wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound targeted to a nucleic acid molecule encoding May1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                  Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathy to pain, post-herpetic neuropathy, arthritic pain, lower back pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder including but not limited to neonatal or infancile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2,MOE wings and a deoxy gap. Used during the antisense inhibition of the parameter of the parame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              wew antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

```

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of inhibits its expression; (2) a method of inhibiting the expression of mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (3) a method of inhibiting an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulators, and cardiavascular activities, and can cophthalmological, immunomodulators and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation Alzheimer's compound disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder. encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or Claim 4; SEQ ID NO 1011; 132pp; English. ischemia.

             antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, notropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chimeric; antisense oligonucleotide; phosphorothioate; human; microscomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microscomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunoomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; vasotropic; ophthalmological; immunoomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder;

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGBS-1). The human mpGBS-1 gene is located on chromosome 9, more specifically to 9444.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGBS-1, which specifically the britise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpGBS-1 in cells or tissues; and (3) a method of treating an animal antisense condition associated with mpGBS-1. MpGBS-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidifammatory, neuroprotective, nootropic, antidifammatory introprotective, nootropic, antisinflammatory introprotective, nootropic, antisinflammatory introprotective, nootropic, antistinfismmatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound condition associated with mpGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; implibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer: disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.
                                            encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                        New antisense compound, having a sequence targeted to a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /mod_base= OTHER

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin B2 synthase (mPGBS-1). The human mPGBS-1 gene is located on chromosome 9, more specifically to operate of the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid mPGBS-1 and mPGBS-1, which specifically hybridise with the nucleic acid mPGBS-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGBS-1 in cells or tissues; and (3) a method of treating an animal companies of oligonucleotides and antisense oligonucleotides and antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiamatory, neuroprotective, nootropic, antisense oligonucleotides and and ni gene therapy. The antisense compound to be used as mPGBS-1 inhibitors and in gene therapy. The antisense compound can be used as mPGBS-1 inhibitors and in gene therapy. The antisense compound confition associated with mPGBS-1 e.g., inflammation, Alzheimer's condition associated with mPGBS-1 e.g., inflammation, Alzheimer's diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Edtaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(8) or expressed product(8), for the prevention and/or treatment of a respiratory or lung disease. The cligonucleotides are useful for reducing or inhibiting expression of a configuration or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor for asthma and/or lung allergies associated with impaction or an inflammation, allergy, anthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary disease (CDPD), cystic fibrosis (CP), chronic obstructive pulmonary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

ADAMIS; metagirdin; MDC1S; a disintegrin and metalloproteinase domain 15; diagnosis; inflammation; therapy; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention is directed to antisense oligonucleotides targeted to ADAMIS (otherwise known as metagirdin, MDCIS, and a disintegrin and metalloproteinase domain 15) and which modulate the expression of ADAMIS. The invention is useful for diagnosing and treating diseases associated human the expression of ADAMIS such as inflammation. The present sequence is human ADAMIS target to oligonucleotide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                            New compound targeted to a nucleic acid molecule encoding ADAM15 and inhibits the expression of ADAM15, useful for modulating the expression of ADAM15 or for diagnosing or treating, e.g. inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= Other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention is directed to antisense oligonucleotides targeted to ADAMIS (otherwise known as metagirdin, MDC15, and a disintegrin and metalloproteinase domain 15) and which modulate the expression of ADAMIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compound targeted to a nucleic acid molecule encoding ADAM15 and inhibits the expression of ADAM15, useful for modulating the expression of ADAM15 or for diagnosing or treating, e.g. inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention is useful for diagnosing and treating diseases associated with expression of ADAMIS such as inflammation. The present sequence is human ADAMIS antisense oligonucleotide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
